

1. Increase your Pitt server space. Go to: my.pitt.edu.>Accounts Self-Service> Email & Messaging > Drop Down "UNIX Quota."
2. Open WinSCP. Enter linux-ts.it.pitt.edu for host name, pitt username, and click login. Enter pitt password, then click okay two or three times.

3. Navigate to the website file you edited, and on the right the directory should be /afs/pitt.edu/(your first initial)/(your second initial)/(your pitt login)/public/html (you may need to create an "html" directory. Right click "new directory" and name it "html")

4. Copy ALL the files from the left to the right (mine does not look the same because my current website is not the same as this example I'm using).

Close WinSCP. It may take a few minutes to update, but your website will be sites.pitt.edu/~(your pitt login) Magic, no? Actually, it's computer science.

5. You are awesome!

(Note: Note, you can run multiple websites from your Pitt Server. Go into your html folder and right click>create directory>name new directory with a single word or words_with_underscores. To access this directory, go to sites.pitt.edu/~yourusername/new_directory)
